Located in Olds, Alberta, Banner Canada's manufacturing and containment facilities meet all requirements of current Good Manufacturing Practices (GMP). Both facilities have been inspected and approved by both Health Canada and the United States FDA. Standardized operating and quality control procedures, meticulous record keeping and strict sanitary controls are found throughout the plant. Our facility has the capabilities to deliver finished product either in bulk or packaged in airtight blister packaging or bottles, according to your specifications.

Our state-of-the-art containment facility provides a safe environment for the development of cytotoxic, potent pharmaceuticals and new chemical entities with unknown toxicological profiles. The containment facility is a stand-alone structure that is separate from the main manufacturing facility, complete with sophisticated environmental controls and segregated processing rooms to provide a contained production environment. Constructed as a building within a building, filtration systems and pressure differentials protect both the internal and external environments. Sophisticated isolation techniques during all phases of product handling ensure maximum protection and a contamination-free environment for your R&D project or full-scale production run.
