

Drug Delivery Technology

Unattractive spray-on coatings that can easily flake or crack are a thing of the past. Banner's clear EnteriCare™ enteric softgels are elegant in appearance and mask unpleasant tastes and odors. In contrast to existing enteric dosage forms, Banner's new EnteriCare™ enteric softgel is not coated. The enteric features of the dosage form reside in the shell itself. The result is a clear enteric dosage form with the same appeal and patient-benefits that the standard softgel offers. Banner's EnteriCare™ enteric softgel meets all USP, EP, JP and BP standards for enteric delivery.

This patent-pending technology builds on our proprietary Gelatin Binary System™ designed for acid-sensitive pharmaceutical compounds, or compounds that tend to cause gastric upset. It is also ideal for compounds targeted at the small intestine, such as drugs to treat Crohn's disease and other intestinal disorders or compounds causing belching, regurgitation, or other gastrointestinal discomfort. As a dosage form preferred by consumers, EnteriCare™ enteric softgels increase the likelihood of compliance and repeat sales.
